

Monitoring Dynamic Environments

CHECKMK CONFERENCE #5 – MUNICH, APRIL 29, 2019

Agenda

1. **THE WORLD IS BECOMING MORE DYNAMIC**
2. HOW THE DCD WORKS
3. DCD FROM A USER PERSPECTIVE
4. TUNING THE DCD LATENCY
5. WHY DOES THIS MATTER?

THE DYNAMIC CONFIGURATION DEAMON

The world is becoming dynamic

Container technology adoption becoming mainstream

Orchestration technology adoption 'fuels' dynamism

Container density per node is increasing

Average container lifetime is decreasing

THE DYNAMIC CONFIGURATION DEAMON

This is why...

We built the Dynamic Configuration Daemon (DCD)

Allows us to automatically adapt check**mk** config also in very dynamic environments

Agenda

1. THE WORLD IS BECOMING MORE DYNAMIC
- 2. HOW THE DCD WORKS**
3. DCD FROM A USER PERSPECTIVE
4. TUNING THE DCD LATENCY
5. WHY DOES THIS MATTER?

HOW IT WORKS

High level overview

DCD runs parallel to the CMC

CMC reloads configuration on the fly

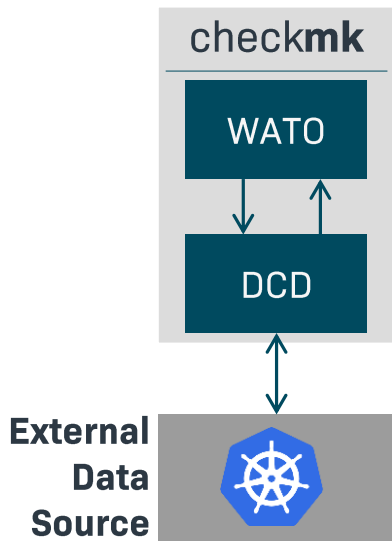

Config changes don't require restart

Remains operational & shifts config to new set-up

HOW IT WORKS

DCD in single-site monitoring

- DCD configured in WATO
- Collects information from source system (e.g. Kubernetes cluster)
- Activates config changes via the WATO API

Distributed DCD: 2-phased approach

Phase 1 (on remote site)

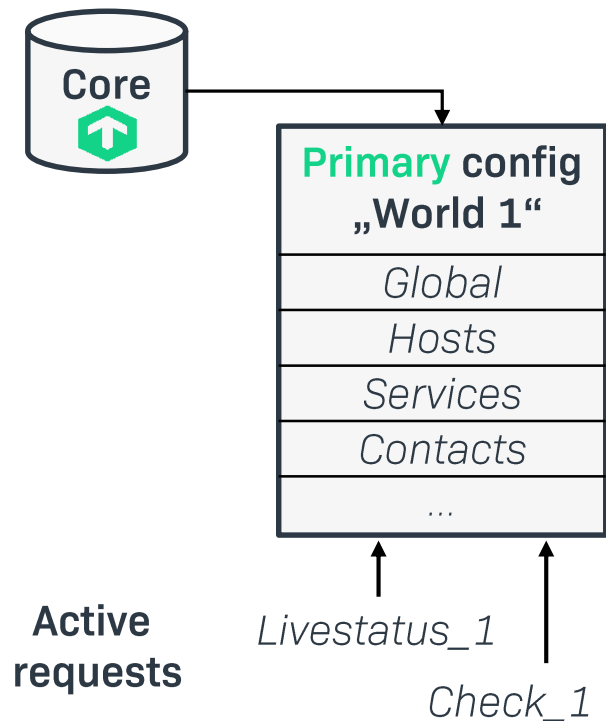

- Collect information from source system (e.g. Kubernetes cluster)
- Produce data for Phase 2

Phase 2 (on master site)

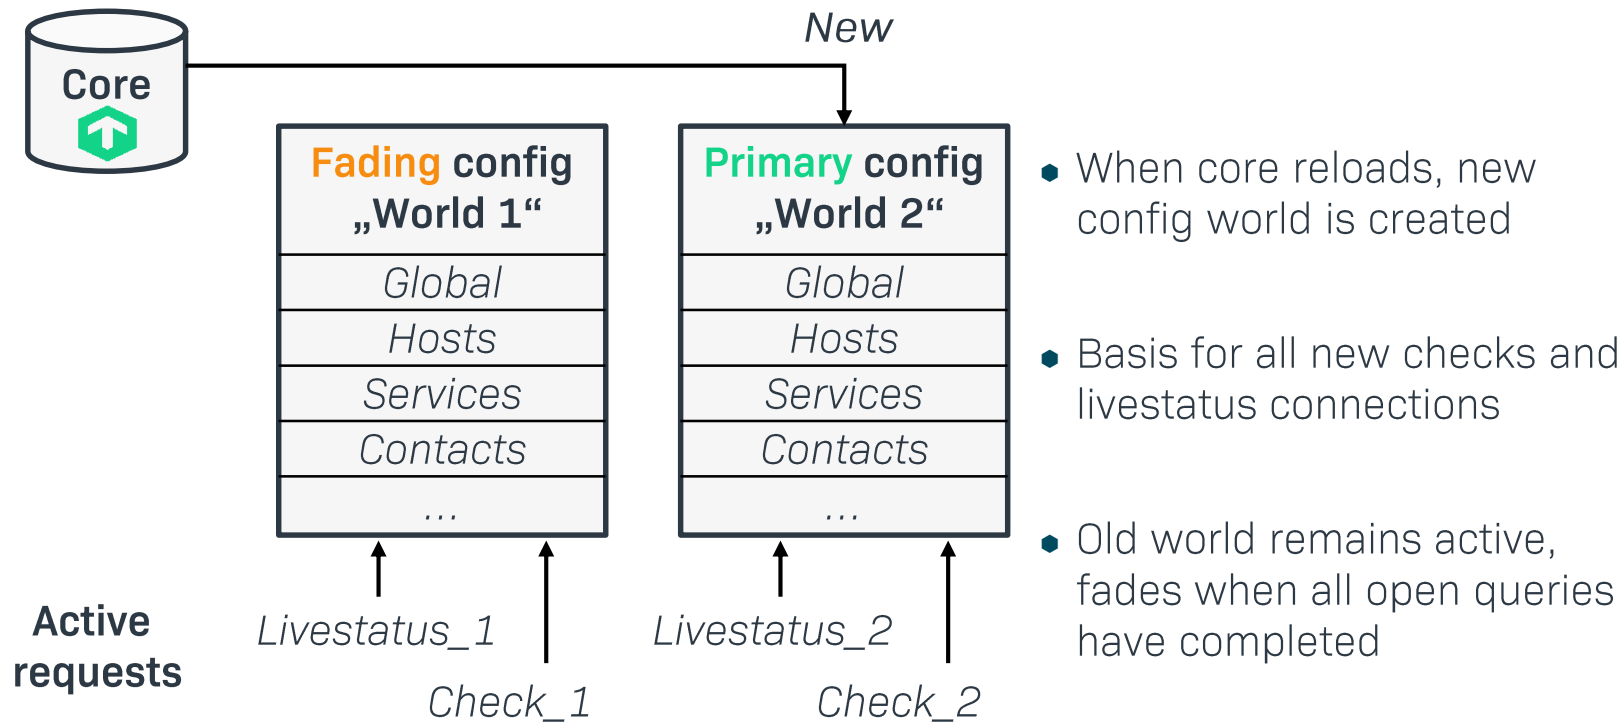

- Collect Phase 2 data from remote site
- Identify deltas & activate necessary changes

Core is configured by config „world“

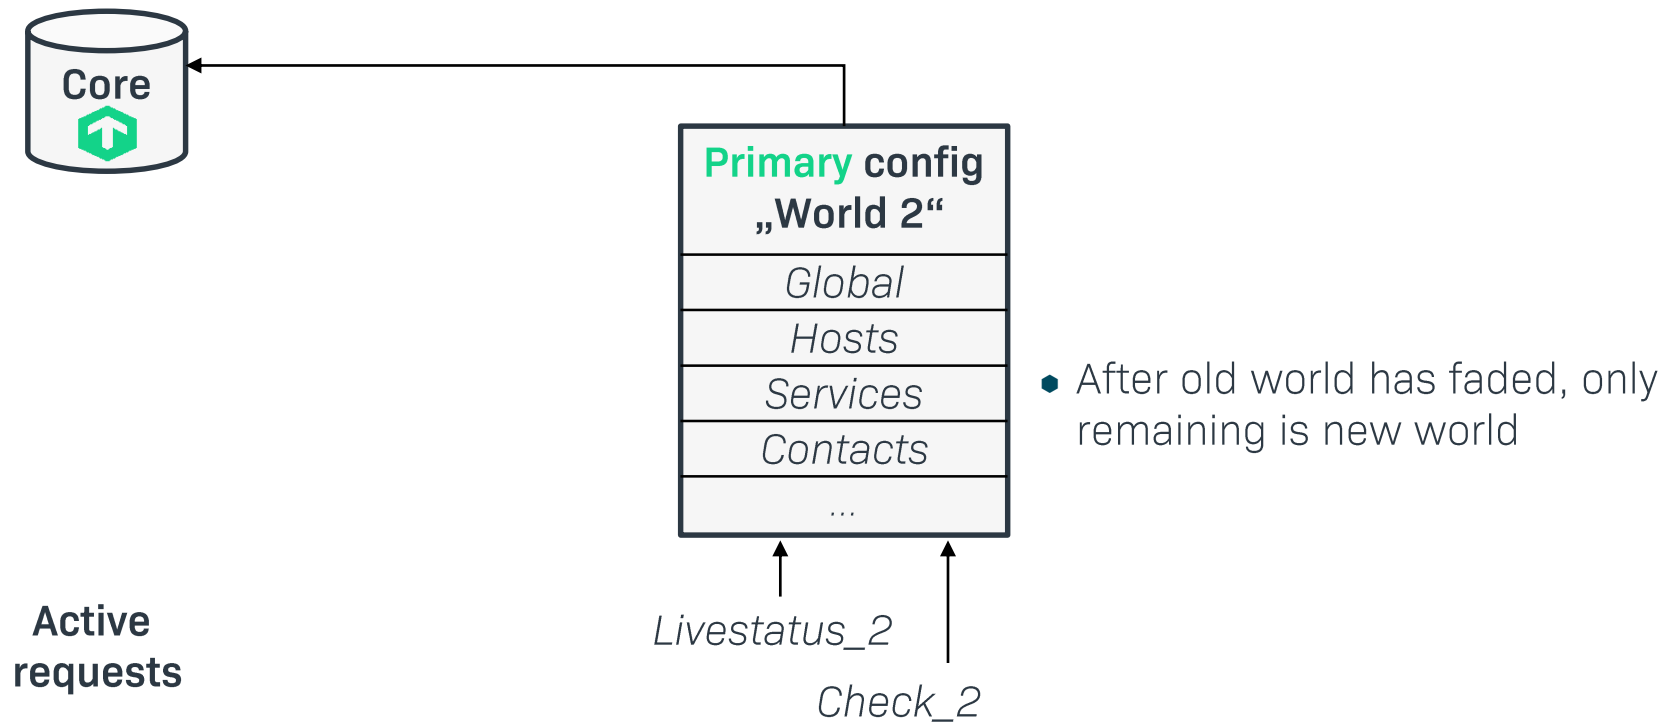

- Config world ‚lives‘ in the Core
- Foundation for Livestatus, checks, ...

When Core reloads, new config world is created

After transition, single config remains

Agenda

1. THE WORLD IS BECOMING MORE DYNAMIC
2. HOW THE DCD WORKS
- 3. DCD FROM A USER PERSPECTIVE**
4. TUNING THE DCD LATENCY
5. WHY DOES THIS MATTER?

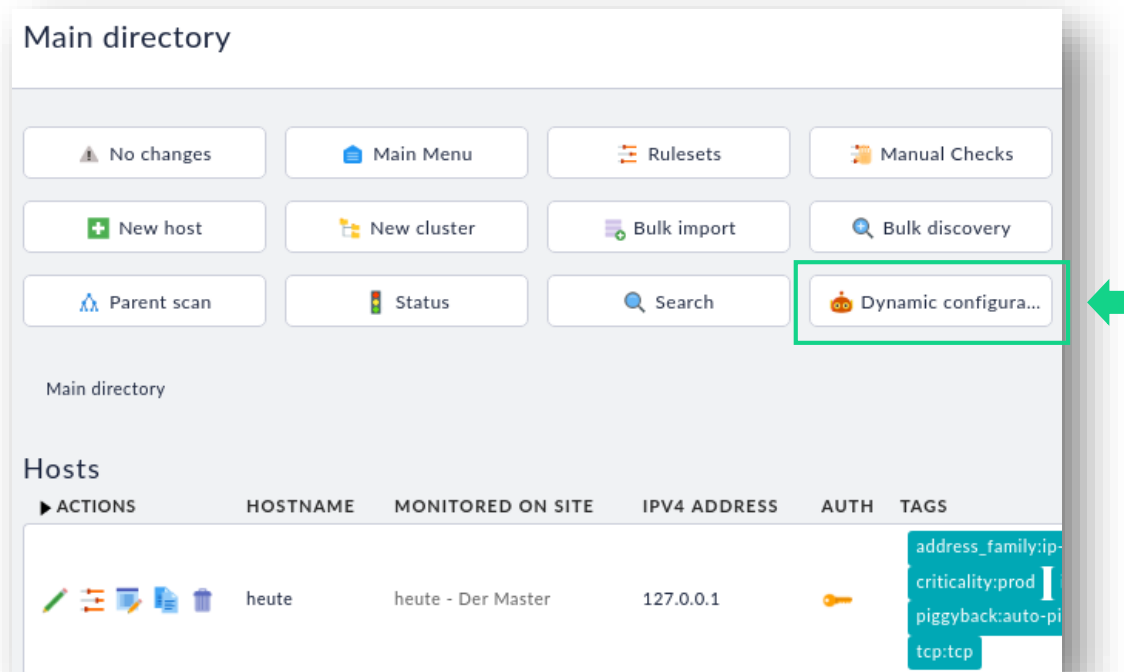

Setting up connections for the DCD

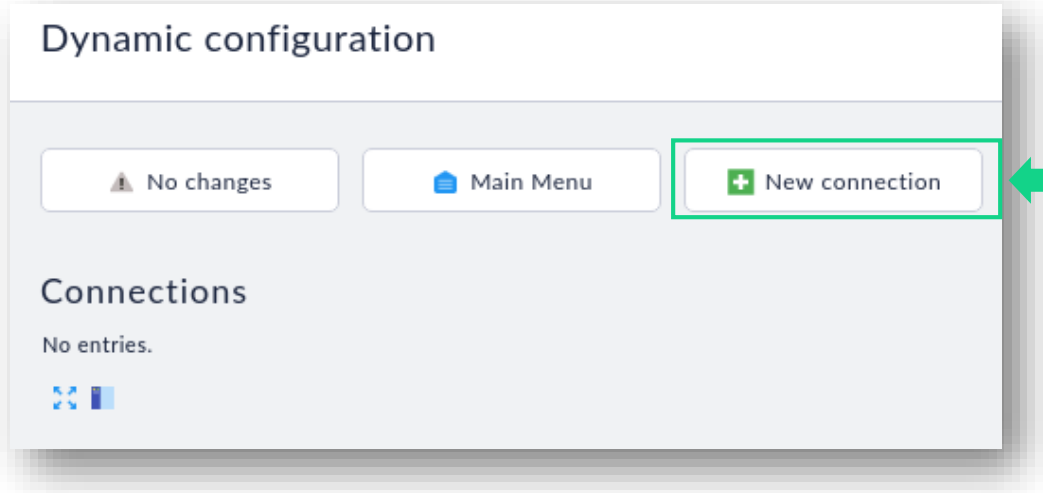

- Dynamic Config connections are set up under WATO → „Hosts“

Setting up connections for the DCD

- Configuration in the checkmk GUI under „Hosts“ → „Dynamic Configuration“

Setting up connections for the DCD

- Set up a „New Connection“
- Each connection configurable to fit need

Configuring the DCD

- Configuration options

Piggyback data ▼

Sync interval

0 days 0 hours 1 mins 0 secs

Create hosts in

Main directory ▼

Discover services during creation

☒

Host attributes to set

  Data sources: SNMP ▼ No SNMP ▼

Add attribute

Delete vanished hosts

☐

☐ Filter by source host

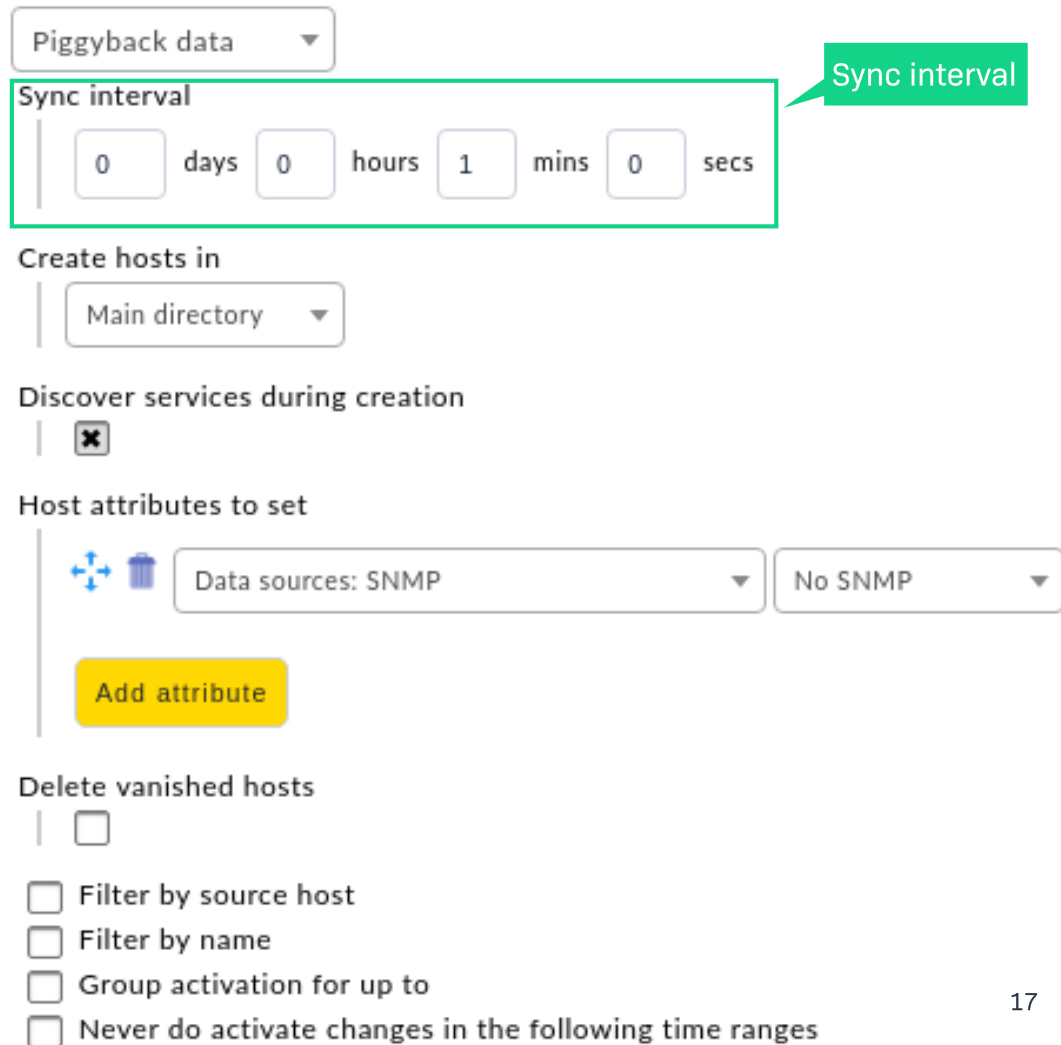

☐ Filter by name

☐ Group activation for up to

☐ Never do activate changes in the following time ranges

Configuring the DCD

- Configuration options
 - Sync interval to read Piggy-Back data

As many connections as needed possible

Connections

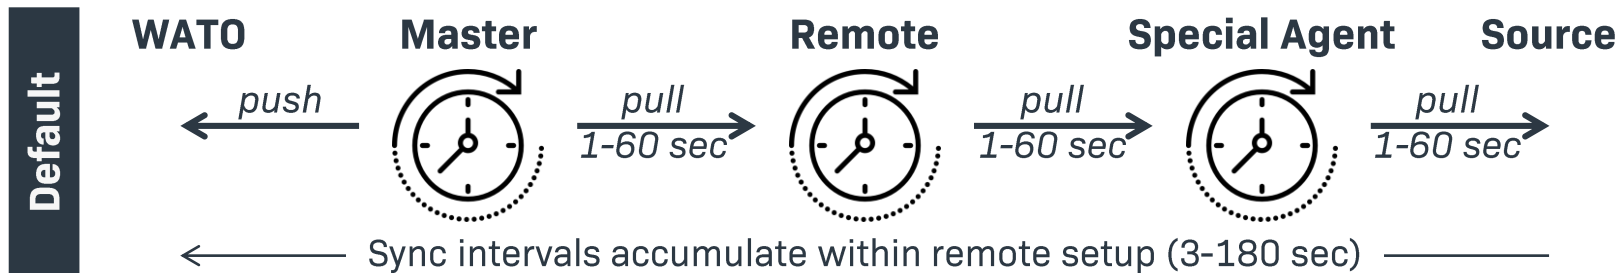

| ▶ ACTIONS | | TITLE | ID | SITE | STATUS | | | | |
|---|--|--------|--------|--------------------|---|------------------------|--------|----------|---------------------|
|      | | Docker | docker | heute - Der Master | ▼ OK (Started at 2019-04-23 15:22:30, duration: 23.7 ms) | | | | |
| | | | | | STEP | MESSAGE | STATUS | DURATION | COMPLETION |
| | | | | |  Phase 1: Executing on 'heute' | Step has been finished | OK | 622 µs | 2019-04-23 15:22:30 |
| | | | | |  Phase 2: Extract result | Step has been finished | OK | 31.9 µs | 2019-04-23 15:22:30 |
| | | | | |  Phase 2: Fetch existing hosts | Step has been finished | OK | 22.7 ms | 2019-04-23 15:22:30 |
| | | | | |  Phase 2: Update config | Nothing changed | OK | 20.0 µs | 2019-04-23 15:22:30 |
| | | | | |  Phase 2: Activation | No activation needed | OK | 2.86 µs | 2019-04-23 15:22:30 |

Agenda

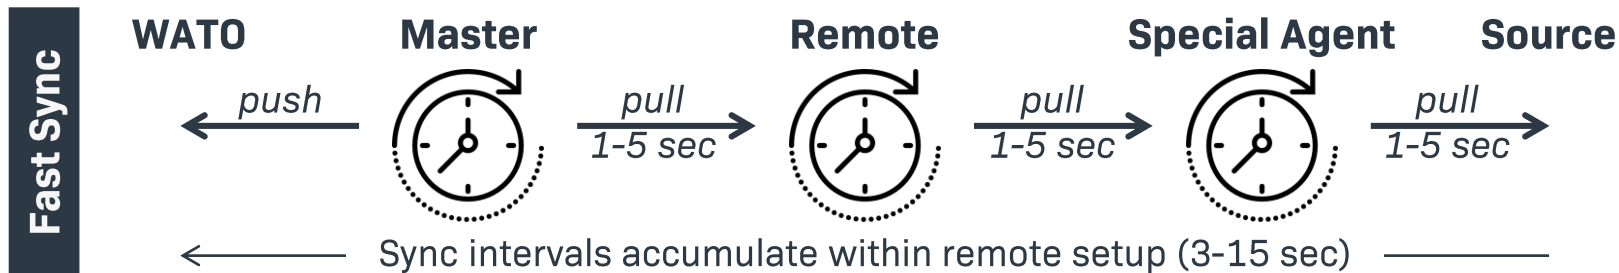

1. THE WORLD IS BECOMING MORE DYNAMIC
2. HOW THE DCD WORKS
3. DCD FROM A USER PERSPECTIVE
- 4. TUNING THE DCD LATENCY**
5. WHY DOES THIS MATTER?

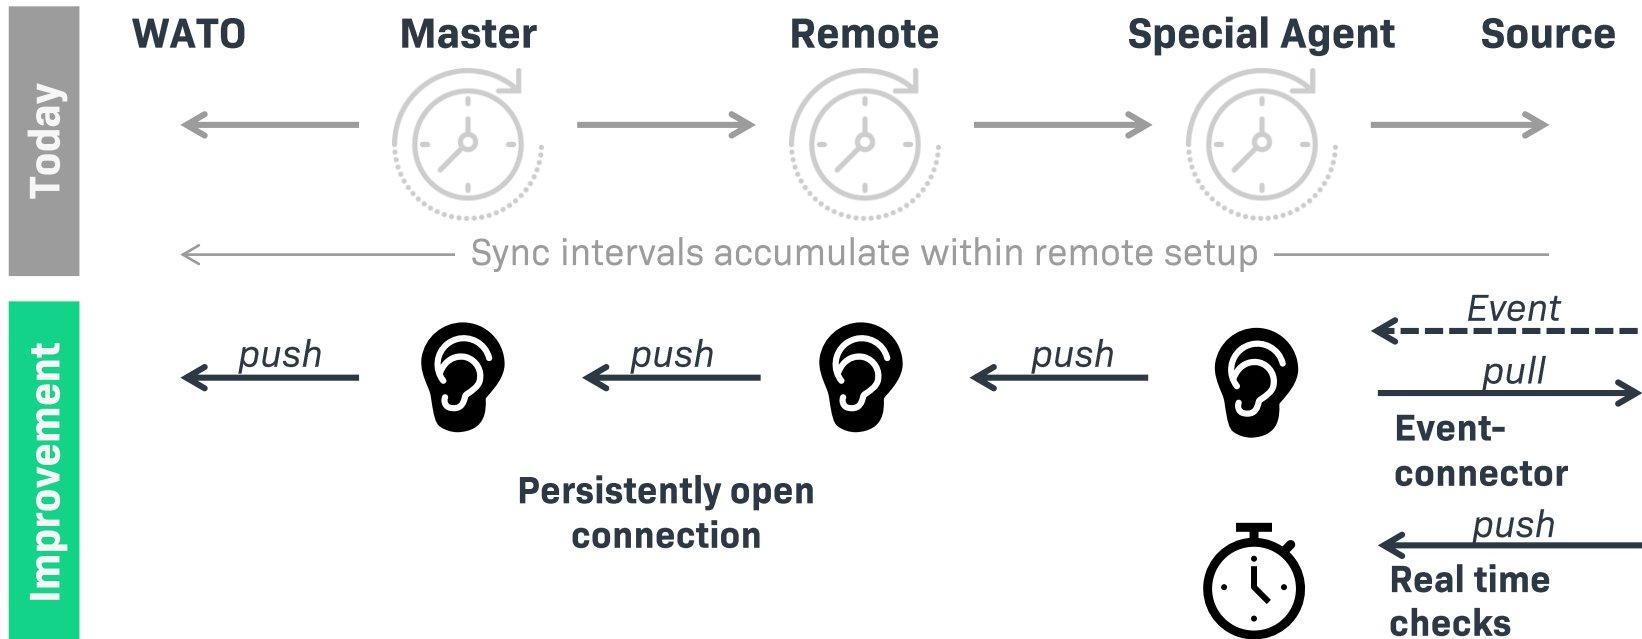

Latency by „cascading“ of default sync intervals

Reduce latency by reducing sync intervals

In extreme cases, further tuning possible

TUNING THE DCD LATENCY

Here we have an Ask to make...

We need **your** help with large scale tests to identify if/where performance optimizations are needed most

Agenda

1. THE WORLD IS BECOMING MORE DYNAMIC
2. HOW THE DCD WORKS
3. DCD FROM A USER PERSPECTIVE
4. TUNING THE DCD LATENCY
5. **WHY DOES THIS MATTER?**

WHY DOES THIS MATTER

Why should I care?

If I am not doing all this modern stuff – is this actually relevant for me?

WHY DOES THIS MATTER

A clear YES!

- All piggybacked services can already use DCD

— **Virtual machines:** Ask vCenter for VMs

— **Cloud Services:** Changes in resources

And many more...

mongoDB®

ORACLE®

tribe29

WHY DOES THIS MATTER

And in the future even more!

- Because dynamic config will automate configuration for many different use cases

— **Network scan:** Ask the network for hosts

— **LDAP:** Ask for users or hosts

— **CMDB:** Ask for changed config mgmt

Thank you!
